Tools and Precision Calculations for Physics Discoveries at Colliders

Introduction

1-loop n -point tensor integrals of rank R : (n,R) -integrals

$$I_n^{\mu_1 \dots \mu_R} = \int \frac{d^d k}{i\pi^{d/2}} \frac{\prod_{r=1}^R k^{\mu_r}}{\prod_{j=1}^n c_j^{\nu_j}}, \quad (1)$$

$d = 4 - 2\epsilon$ and denominators c_j have *indices* ν_j and *chords* q_j

$$c_j = (k - q_j)^2 - m_j^2 + i\epsilon \quad (2)$$

tensor integrals due to:

- fermion propagators
- three-gauge boson couplings
- e.g. unitary gauge propagators

A simple example

1-loop self-energy:

$$\begin{aligned}
 I_2^\mu &= \int \frac{d^d k}{i\pi^{d/2}} \frac{k^\mu}{[k^2 - M_1^2][(k+p)^2 - M_2^2]} \\
 &= p_\mu B_1
 \end{aligned}$$

Solve:

$$\begin{aligned}
 p_\mu I_2^\mu &= p^2 B_1(p, M_1, M_2) \\
 &= \int \frac{d^d k}{i\pi^{d/2}} \frac{pk}{[k^2 - M_1^2][(k+p)^2 - M_2^2]} = \int \frac{d^d k}{i\pi^{d/2}} \frac{pk}{D_1 D_2} \\
 &= \int \frac{d^d k}{i\pi^{d/2}} \left[\frac{D_2 - (p^2 - M_2^2 - M_1^2) - D_1}{D_1 D_2} \right],
 \end{aligned}$$

$$B_1(p, M_1, M_2) = \frac{1}{2p^2} \left[A_0(M_1) - A_0(M_2) - (p^2 - M_2^2 - M_1^2) B_0(p, M_1, M_2) \right]$$

A **tensor** Feynman integral is expressed in terms of **scalar** Feynman integrals.

Systematic approach:

Passarino, Veltman 1978 [1]

Need in addition a library of scalar functions:

'tHooft, Veltman 1979 [2]

State of the art:

Hahn, LoopTools/FF [3, 4]

This talk: derive efficient reduction formulae in the algebraic
Fleischer-Davydychev-Tarasov approach

The original Passarino-Veltman reduction allows to express tensor integrals by a small set of scalar 4-,3-,2-,1-point functions integrals in d dimensions.

- Need Extensions: Reduction of n -point functions with $n > 4$
- Need Improvements: Avoid the break-down in certain kinematical configurations

Recent developments in the Fleischer-Davydychev-Tarasov approach

- get tensor reduction such that one may ... :
- ... **kill** pentagon Gram determinants
- ... **treat** sub-diagram Gram determinants

Notations: $I_{n-1}^{\{\mu_1, \dots\}, s}$ etc.

The tensor integral $I_{n-1, ab}^{\{\mu_1, \dots\}, s}$ is obtained from the integral $I_n^{\{\mu_1, \dots\}}$ by

- shrinking line s
- raising the powers of inverse propagators a, b

$$\mathbf{s}^- \mathbf{a}^+ \mathbf{b}^+ I_n^{\{\mu_1, \dots\}} = I_{n-1, ab}^{\{\mu_1, \dots\}, s} \quad (3)$$

The operators $\mathbf{i}^\pm, \mathbf{j}^\pm, \mathbf{k}^\pm$ act by shifting the indices ν_i, ν_j, ν_k by ± 1 .

Notations: Gram and modified Cayley determinant, signed minors [Melrose:1965]

Gram determinant G_n :

$$G_n = |2q_i q_j|, i, j = 1, \dots, n \quad (4)$$

Modified Cayley determinant $()_N$ of a diagram with N internal lines and chords q_j :

$$()_N \equiv \begin{vmatrix} 0 & 1 & 1 & \dots & 1 \\ 1 & Y_{11} & Y_{12} & \dots & Y_{1N} \\ 1 & Y_{12} & Y_{22} & \dots & Y_{2N} \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ 1 & Y_{1N} & Y_{2N} & \dots & Y_{NN} \end{vmatrix}, \quad (5)$$

with matrix elements

$$Y_{ij} = -(q_i - q_j)^2 + m_i^2 + m_j^2, \quad (i, j = 1 \dots N) \quad (6)$$

For a choice $q_n = 0$, both determinants are related: $()_N = -G_{N-1}$

⇒ The **Gram** determinant $()_N$ does not depend on the masses.

Notations: signed minors [Melrose:1965]

signed minors of $(\)_N$ are constructed by deleting m rows and m columns from $(\)_N$, and multiplying with a sign factor:

$$\begin{aligned} \begin{pmatrix} j_1 & j_2 & \cdots & j_m \\ k_1 & k_2 & \cdots & k_m \end{pmatrix}_N &\equiv \\ &\equiv (-1)^{\sum_i (j_i + k_i)} \operatorname{sgn}_{\{j\}} \operatorname{sgn}_{\{k\}} \left| \begin{array}{c} \text{rows } j_1 \cdots j_m \text{ deleted} \\ \text{columns } k_1 \cdots k_m \text{ deleted} \end{array} \right| \end{aligned} \quad (7)$$

where $\operatorname{sgn}_{\{j\}}$ and $\operatorname{sgn}_{\{k\}}$ are the signs of permutations that sort the deleted rows $j_1 \cdots j_m$ and columns $k_1 \cdots k_m$ into ascending order.

Example:

$$\begin{pmatrix} 0 \\ 0 \end{pmatrix}_N \equiv \begin{vmatrix} Y_{11} & Y_{12} & \cdots & Y_{1N} \\ Y_{12} & Y_{22} & \cdots & Y_{2N} \\ \vdots & \vdots & \ddots & \vdots \\ Y_{1N} & Y_{2N} & \cdots & Y_{NN} \end{vmatrix}, \quad (8)$$

Example: Getting a 4-point function from a six-point function I

Figure: A six-point topology (a) leading to four-point functions (b) with realistically vanishing Gram determinants.

Example: Getting a 4-point function from a six-point function II

The example is taken from [11].

The corresponding 4-point tensor integrals are, in LoopTools [3, 12] notation:

$$D0i(\text{id}, 0, 0, s_{\bar{\nu}U}, t_{ed}, t_{\bar{e}\mu}, s_{\mu\bar{\nu}U}, 0, M_Z^2, 0, 0). \quad (9)$$

The Gram determinant is:

$$(\)_4 = -2t_{\bar{e}\mu}[s_{\mu\bar{\nu}U}^2 + s_{\bar{\nu}U}t_{ed} - s_{\mu\bar{\nu}U}(s_{\bar{\nu}U} + t_{ed} - t_{\bar{e}\mu})], \quad (10)$$

It vanishes if:

$$t_{ed} \rightarrow t_{ed,\text{crit}} = \frac{s_{\mu\bar{\nu}U}(s_{\mu\bar{\nu}U} - s_{\bar{\nu}U} + t_{\bar{e}\mu})}{s_{\mu\bar{\nu}U} - s_{\bar{\nu}U}}. \quad (11)$$

In terms of a dimensionless scaling parameter x ,

$$t_{ed} = (1 + x)t_{ed,\text{crit}}, \quad (12)$$

Example: Getting a 4-point function from a six-point function III

the Gram determinant becomes:

$$(\cdot)_4 = 2 \times s_{\mu\bar{\nu}U} t_{\bar{\theta}\mu} (s_{\mu\bar{\nu}U} - s_{\bar{\nu}U} + t_{\bar{\theta}\mu}). \quad (13)$$

We will also need the modified Cayley determinant:

$$\begin{aligned} \begin{pmatrix} 0 \\ 0 \end{pmatrix}_4 &= \begin{pmatrix} 2M_Z^2 & M_Z^2 & M_Z^2 - s_{\mu\bar{\nu}U} & M_Z^2 \\ M_Z^2 & 0 & -s_{\bar{\nu}U} & M_Z^2 \\ M_Z^2 - s_{\mu\bar{\nu}U} & -s_{\bar{\nu}U} & 0 & -t_{ed} \\ M_Z^2 & -t_{\bar{\theta}\mu} & -t_{ed} & 0 \end{pmatrix} \\ &= s_{\mu\bar{\nu}U}^2 t_{\bar{\theta}\mu}^2 + 2 M_Z^2 t_{\bar{\theta}\mu} [-2s_{\bar{\nu}U} t_{ed} + s_{\mu\bar{\nu}U} (s_{\bar{\nu}U} + t_{ed} - t_{\bar{\theta}\mu})] \\ &\quad + M_Z^4 (s_{\bar{\nu}U}^2 + (t_{ed} - t_{\bar{\theta}\mu})^2 - 2s_{\bar{\nu}U} (t_{ed} + t_{\bar{\theta}\mu})). \end{aligned}$$

Recursions for hexagons

Express any hexagon by pentagons

[Fleischer:1999,Binoth:2005,Denner:2005,Diakonidis:2008 [7, 13, 14, 8]]

$$I_6^{\mu_1 \dots \mu_{R-1} \rho} = - \sum_{s=1}^6 I_5^{\mu_1 \dots \mu_{R-1}, s} \bar{Q}_s^\rho. \quad (14)$$

auxiliary vectors

$$\bar{Q}_s^\rho = \sum_{i=1}^6 q_i^\rho \frac{\binom{0s}{0i}_6}{\binom{0}{0}_6}, \quad s = 1 \dots 6. \quad (15)$$

Dimensional shifts and recurrence relations for pentagons (I)

Following [Davydychev:1991 [5]]

Replace tensors by scalar integrals in higher dimensions:

Example $R = 3$:

$$\begin{aligned}
 I_5^{\mu\nu\lambda} &= \int \frac{d^{4-2\epsilon}k}{i\pi^{d/2}} \prod_{r=1}^5 c_r^{-1} k^\mu k^\nu k^\lambda & (16) \\
 &= - \sum_{i,j,k=1}^4 q_i^\mu q_j^\nu q_k^\lambda n_{ijk} I_{5,ijk}^{[d+]} + \frac{1}{2} \sum_{i=1}^{n-1} (g^{\mu\nu} q_i^\lambda + g^{\mu\lambda} q_i^\nu + g^{\nu\lambda} q_i^\mu) I_{5,i}^{[d+]} ,
 \end{aligned}$$

and $n_{ijk} = (1 + \delta_{ij})(1 + \delta_{ik} + \delta_{jk})$.

$[d+]^i = 4 - 2\epsilon + 2i$, and for definition of $I_{5,i}^{[d+]}$ etc. see (3).

Dimensional shifts and recurrence relations for pentagons (II)

'Naive', direct approach – just perform dimensional recurrences

Following [Tarasov:1996, Fleischer:1999 [6, 7]]

apply **recurrence relations**, relating scalar integrals of different dimensions, in order to get rid of the dimensionalities $[d+]^l = 4 - 2\epsilon + 2l$:

$$\nu_j(\mathbf{j}^+ l_5^{[d+]}) = \frac{1}{(0)_5} \left[-\binom{j}{0}_5 + \sum_{k=1}^5 \binom{j}{k}_5 \mathbf{k}^- \right] l_5 \quad (17)$$

$$\left(d - \sum_{i=1}^5 \nu_i + 1 \right) l_5^{[d+]} = \frac{1}{(0)_5} \left[\binom{0}{0}_5 - \sum_{k=1}^5 \binom{0}{k}_5 \mathbf{k}^- \right] l_5, \quad (18)$$

where the operators $\mathbf{i}^\pm, \mathbf{j}^\pm, \mathbf{k}^\pm$ act by shifting the indices ν_i, ν_j, ν_k by ± 1 .

Dimensional shifts and recurrence relations for pentagons (III)

Represent a pentagon tensor of rank R :

After repeated use of the recurrence relations, all the higher dimensional scalar integrals disappear

- A representation by the **simple scalar functions in d dimensions** is achieved:

self-energies B_0

vertices C_0

boxes D_0

- For the tensor rank R one gets

inverse powers of Gram determinants: $\left(\frac{1}{\Delta_5}\right)^R$

The algebraic derivations have to be re-organized in order to cancel in a controlled way these inverse powers of Gram determinants

The result of simplifying manipulations [indicated in the backup slides (mark 8)] ...

... and collecting all contributions, our final result for e.g. the tensor of rank $R = 3$ can be written as follows:

$$I_5^{\mu\nu\lambda} = \sum_{i,j,k=1}^4 q_i^\mu q_j^\nu q_k^\lambda E_{ijk} + \sum_{k=1}^4 g^{[\mu\nu} q_k^{\lambda]} E_{00k}, \quad (19)$$

with:

$$E_{00j} = \sum_{s=1}^5 \frac{1}{\binom{0}{0}_5} \left[\frac{1}{2} \binom{0s}{0j}_5 I_4^{[d+],s} - \frac{d-1}{3} \binom{s}{j}_5 I_4^{[d+]^2,s} \right], \quad (20)$$

$$E_{ijk} = - \sum_{s=1}^5 \frac{1}{\binom{0}{0}_5} \left\{ \left[\binom{0j}{sk}_5 I_4^{[d+]^2,s} + (i \leftrightarrow j) \right] + \binom{0s}{0k}_5 \nu_{ij} I_4^{[d+]^2,s} \right\}. \quad (21)$$

- ✓ no scalar 5-point integrals in higher dimensions
- ✓ no inverse Gram det. $\binom{0}{0}_5$

We have yet:

† scalar 4-point integrals in higher dimensions: $I_{4,ij}^{[d+]^2,s}$ etc.

† inverse Gram det. $\binom{0}{0}_5 \equiv \binom{0}{0}_4$

Isolation of inverse sub-Gram $\det^s ()_4$

We have now two kinds of objects in higher \dim^s to be evaluated:

$$I_4^s, I_4^{[d+],s}, I_4^{[d+]^2,s} \quad \text{boxes} \quad (22)$$

$$I_{4,i}^{[d+],s}, I_{4,i}^{[d+]^2,s}, I_{4,ij}^{[d+]^2,s} \quad \text{boxes with higher indices} \quad (23)$$

Application of dimension-shifting recurrence relations produces powers of $1/()_4$.

They will be the **unwanted and unavoidable sub-Gram-determinants** $()_4$.

Next – and last – two steps:

- Reduce the $I_{4,i}^{[d+],s}, I_{4,i}^{[d+]^2,s}, I_{4,ij}^{[d+]^2,s}$ etc. to non-indexed scalars
- Then look at the non-indexed scalars

Reduce $I_{4,ij\dots}^{[d+]',s}$ to $I_4^{[d+]',s}$ plus simpler objects I

By nontrivial manipulations we get e.g.:

$$I_{4,i}^{[d+],s} = \frac{1}{\binom{0s}{0s}_5} \left[-\binom{0s}{is}_5 (d-3) I_4^{[d+],s} + \sum_{t=1}^5 \binom{0st}{0si}_5 I_3^{st} \right] \quad (24)$$

$$\begin{aligned} \nu_{ij} I_{4,ij}^{[d+]^2} = & \frac{\binom{0}{i}_4 \binom{0}{j}_4}{\binom{0}{0}_4 \binom{0}{0}_4} (d-2)(d-1) I_4^{[d+]^2} + \frac{\binom{0j}{0j}_4}{\binom{0}{0}_4} I_4^{[d+]} \\ & - \frac{\binom{0}{j}_4}{\binom{0}{0}_4} \frac{d-2}{\binom{0}{0}_4} \sum_{t=1}^4 \binom{0t}{0i}_4 I_3^{[d+],t} + \frac{1}{\binom{0}{0}_4} \sum_{t=1}^4 \binom{0t}{0j}_4 I_{3,i}^{[d+],t} \quad (25) \end{aligned}$$

These equations are free of inverse Gram determinants $(\)_4$.

But they contain yet the generic 4-point and (partly indexed) 3-point functions in higher dimensions, $I_4^{[d+],s}$, $I_3^{[d+],t}$, etc.

Last step: evaluate the $I_4^{[d+],s}$, $I_3^{[d+],t}$, etc. |

Several strategies are now possible:

- Just evaluate them **analytically** in $d + 2l - 2\epsilon$ dimensions – if you may do that
- Just evaluate them **numerically** in $d + 2l - 2\epsilon$ dimensions
- **Reduce** them further by recurrences – buy the towers of $1/()_4 \rightarrow$ apply (18)
- Make a **small Gram determinant expansion** \rightarrow apply (18) another way round

Last two items are done here.

Reduction of scalars I_4^D to the generic dimension $\rightarrow I_4^d = D_0, I_3^d = C_0$ |

Non-small 4-point Gram determinants:

Direct, iterative use of (18) yields e.g.:

$$I_4^{[d+]'l} = \left[\frac{\binom{0}{0}_4}{\binom{0}{0}_4} I_4^{[d+]'l-1} - \sum_{t=1}^4 \frac{\binom{t}{0}_4}{\binom{t}{0}_4} I_3^{[d+]'l-1,t} \right] \frac{1}{d+2l-5} \quad (26)$$

$$I_3^{[d+]'l,t} = \left[\frac{\binom{0t}{0t}_4}{\binom{t}{t}_4} I_3^{[d+]'l-1,t} - \sum_{u=1, u \neq t}^4 \frac{\binom{ut}{0t}_4}{\binom{t}{t}_4} I_2^{[d+]'l-1,tu} \right] \frac{1}{d+2l-4} \quad (27)$$

And we are done.

This works fine if $(\)_4$ is not small.

Make a small Gram expansion I

Again use (18):

$$({}_4) (d - \sum_{i=1}^4 \nu_i + 1) I_4^{[d+]} = \left[\begin{pmatrix} 0 \\ 0 \end{pmatrix}_4 I_4 - \sum_{k=1}^4 \begin{pmatrix} 0 \\ k \end{pmatrix}_4 I_3^k \right]$$

If $({}_4) = 0$, then it follows ($n = 4$):

$$I_n^D = \sum_k^n \frac{\binom{0}{k}_n}{\binom{0}{0}_n} I_{n-1}^{D,k} \quad (28)$$

If $({}_4) \ll 1$, re-write (18), as follows:

$$I_n^D = \sum_k^n \frac{\binom{0}{k}_n}{\binom{0}{0}_n} I_{n-1}^{D,k} - \frac{({}_4)_n}{\binom{0}{0}_n} \left[(D+1) - \sum_i^n \nu_i \right] I_n^{D+2}. \quad (29)$$

Effectively we may evaluate I_n^D in terms of simpler functions $I_{n-1}^{D,k}$ with a small correction depending on I_n^{D+2} .

We may go a step further, and insert into (29) for I_n^{D+2} the rhs. of (28), taken now at $D' = D + 2$:

$$\begin{aligned}
 I_n^D &= \sum_k^n \frac{\binom{0}{k}_n}{\binom{0}{0}_n} I_{n-1}^{D,k} \\
 &\quad - \frac{\binom{0}{0}_n}{\binom{0}{0}_n} [(D+1) - \sum_i^n \nu_i] \\
 &\quad \times \left[\sum_k^n \frac{\binom{0}{k}_n}{\binom{0}{0}_n} I_{n-1}^{D+2,k} - \frac{\binom{0}{0}_n}{\binom{0}{0}_n} [(D+3) - \sum_i^n \nu_i] I_n^{D+4} \right].
 \end{aligned}$$

The terms proportional to $[(0)_n / \binom{0}{0}_n]^a$, $a = 0, 1$ may be evaluated at the correct kinematics. They depend on three-point functions, and their reduction by normal recurrences will not introduce the unwanted powers of $1/(0)_4$. The last term, suppressed by the factor $[(0)_n / \binom{0}{0}_n]^2$, depends on I_n^{D+4} . It may either be taken approximately at $(0)_n = 0$, where it can also be represented by 3-point functions (and their reductions), or it may be evaluated more correctly by another iteration based on (28).

And so on and so on

In the numerical example – next section – we worked out up to 10 stable iterations.

A quite similar attempt to perform such a series of approximations was undertaken in [15] (see equation (5) there), where a specific example, forward light-by-light scattering through a massless fermion loop, was studied. The approach was then not further followed.

W. Giele, E. W. N. Glover, and G. Zanderighi,
in: Proceedings of Loops and Legs 2004:
Numerical evaluation of one-loop diagrams near exceptional momentum configurations,

An example from A. Denner [11]: 4-point tensor of rank 3 D_{111}

Few figures copied from: A. Denner, plenary talk DESY Theory Workshop 2009, p.69 (backup transparency)

box integral

appears, e.g., in subgraph of diagram

$$\text{Gram det.: } \Delta^{(N)} \rightarrow 0 \quad \text{if} \quad t_{e\bar{d}} \rightarrow t_{\text{crit}} \equiv \frac{s_{\mu\bar{\nu}u}(s_{\mu\bar{\nu}u} - s_{\bar{\nu}u} + t_{\bar{e}\mu})}{s_{\mu\bar{\nu}u} - s_{\bar{\nu}u}}$$

The figure demonstrates the effects of careful treatment of vanishing Gram determinant (Δ)₄.

Gram det.: $\Delta^{(N)} \rightarrow 0$ if $t_{e\bar{d}} \rightarrow t_{\text{crit}} \equiv \frac{s_{\mu\bar{\nu}u}(s_{\mu\bar{\nu}u} - s_{\bar{\nu}u} + t_{\bar{e}\mu})}{s_{\mu\bar{\nu}u} - s_{\bar{\nu}u}}$

numerical comparison: maximal tensor rank = 6 (similar to $ee \rightarrow 4f$ application)

Absolute predictions

Relative deviations from "best"

Passarino--Veltman region

$$x \equiv \frac{t_{e\bar{d}}}{t_{\text{crit}}} - 1$$

$$s_{\mu\bar{\nu}u} = +2 \times 10^4 \text{ GeV}^2$$

$$s_{\bar{\nu}u} = +1 \times 10^4 \text{ GeV}^2$$

$$t_{\bar{e}\mu} = -4 \times 10^4 \text{ GeV}^2$$

$$t_{\text{crit}} = -6 \times 10^4 \text{ GeV}^2$$

PV reduction breaks down,
but Gram exp. stable
for $\Delta^{(N)} \rightarrow 0$!

Following Davydychev, [5], one gets

$$I_4^{\mu\nu\lambda} = \int^d \frac{k^\mu k^\nu k^\lambda}{\prod_{r=1}^n c_r} = - \sum_{i,j,k=1}^n q_i^\mu q_j^\nu q_k^\lambda \nu_{ijk} I_{n,ijk}^{[d+]}{}^3 + \frac{1}{2} \sum_{i=1}^n g^{[\mu\nu} q_i^{\lambda]} I_{n,i}^{[d+]}{}^2 \quad (30)$$

We identify the tensor coefficient D_{111} a la LoopTools:

$$D_{111} \sim \nu_{ijk} I_{4,ijk}^{[d+]}{}^3 \quad \text{for } ijk = 222$$

Rank $R = 4$ tensor D_{1111} – Numerics with dimensional recurrences

From (29) we see that a “small Gram determinant” expansion will be useful when the following dimensionless parameter becomes small:

$$R = \frac{()_4}{\binom{0}{0}_4} \times s, \quad (31)$$

where s is a typical scale of the process, e.g. we will choose $s = s_{\mu\bar{\nu}U}$.
Following [11], we further choose:

$$\begin{aligned} s_{\mu\bar{\nu}U} &= 2 \times 10^4 \text{ GeV}^2, \\ s_{\bar{\nu}U} &= 1 \times 10^4 \text{ GeV}^2, \\ t_{\bar{e}\mu} &= -4 \times 10^4 \text{ GeV}^2, \end{aligned}$$

and get $t_{ed,\text{crit}} = -6 \times 10^4 \text{ GeV}^2$. For $x=1$, the Gram determinant becomes $()_4 = 4.8 \times 10^{13} \text{ GeV}^3$.
The small expansion parameter $R(x)$ and D_{1111} are shown in figure 2.

Summary

- Recursive treatment of hexagon and pentagon tensor integrals of rank R in terms of pentagons and boxes of rank $R - 1$
- Systematic derivation of expressions which are explicitly free of inverse Gram determinants $()_5$ until pentagons of rank $R = 5$
- Proper isolation of inverse Gram determinants of subdiagrams of the type $\binom{s}{s}_n$, which cannot be completely avoided
- Some numerics, so far in Mathematica, and a numerical C++ package (together with V. yundin) under way

Algebraic simplifications, 1st step

With the identity

$$\binom{0}{i}_5 \binom{s}{i}_5 = \binom{0s}{0i}_5 \binom{0}{i}_5 + \binom{0}{i}_5 \binom{s}{0}_5 \quad (32)$$

we eliminate the inverse Gram determinant from all terms with exclusion of Q_0^μ :

$$I_5^{\mu_1 \dots \mu_{R-1} \mu} = \left[I_5^{\mu_1 \dots \mu_{R-1}} - \sum_{s=1}^5 \frac{\binom{s}{0}_5}{\binom{0}{0}_5} I_4^{\mu_1 \dots \mu_{R-1}, s} \right] Q_0^\mu - \sum_{s=1}^5 I_4^{\mu_1 \dots \mu_{R-1}, s} \bar{Q}_s^\mu \quad (33)$$

The auxiliary vectors \bar{Q}_s^μ were introduced already for $n = 6$:

$$Q_0^\mu = \sum_{i=1}^5 q_i^\mu \frac{\binom{0}{i}_5}{\binom{0}{0}_5} \quad \text{while} \quad \bar{Q}_s^\mu = \sum_{i=1}^5 q_i^\mu \frac{\binom{0s}{0i}_5}{\binom{0}{0}_5} \quad (34)$$

Algebraic simplifications, 2nd step I

Have to show for the product $T^{\mu_1 \dots \mu_{R-1}} \times Q_0^\mu$ that the Gram determinant cancels.

This came out to be a complicated task.

$$T^{\mu_1 \dots \mu_{R-1}} = \left[\begin{array}{c} \binom{0}{0} \\ \binom{0}{0} \end{array} \right]_5 I_5^{\mu_1 \dots \mu_{R-1}} - \sum_{s=1}^5 \left[\begin{array}{c} \binom{s}{0} \\ \binom{0}{0} \end{array} \right]_5 I_4^{\mu_1 \dots \mu_{R-1}, s} \quad (35)$$

Example: For $R = 3$ pentagons need rank 2 tensor:

$$T^{\mu\nu} = \left[\begin{array}{c} \binom{0}{0} \\ \binom{0}{0} \end{array} \right]_5 I_5^{\mu\nu} - \sum_{s=1}^5 \left[\begin{array}{c} \binom{s}{0} \\ \binom{0}{0} \end{array} \right]_5 I_4^{\mu\nu, s} \quad (36)$$

Algebraic simplifications, 2nd step I

Example $R = 3$: the building blocks are here $I_5^{\mu\nu}$ and $I_4^{\mu\nu}$:

$$\begin{aligned}
 I_5^{\mu\nu} &= \sum_{i,j=1}^5 q_i^\mu q_j^\nu \left[(1 + \delta_{ij}) I_{5,ij}^{[d+]} \right] + g^{\mu\nu} \left[-\frac{1}{2} I_5^{[d+]} \right] \\
 &\Rightarrow \text{work!!!} \sum_{i,j=1}^4 q_i^\mu q_j^\nu \frac{1}{\binom{0}{0}_5} \sum_{s=1}^5 \left[\binom{0i}{sj}_5 I_4^{[d+],s} + \binom{0s}{0j}_5 I_{4,i}^{[d+],s} \right] \\
 &\quad + g^{\mu\nu} \left[-\frac{1}{2} \frac{1}{\binom{0}{0}_5} \sum_{s=1}^5 \binom{s}{0}_5 I_4^{[d+],s} \right] \quad (37)
 \end{aligned}$$

See: The $I_5^{\mu\nu}$ had already been made free of $1/\binom{0}{0}_5$.

Davydychev's higher dimensional integrals

The second term with $I_4^{\mu\nu}$ is a typical example of [Davydychev:1991 [5]] : tensor \Rightarrow scalars in $d + 2$

$$I_4^{\mu\nu} = \sum_{i,j=1}^4 q_i^\mu q_j^\nu \left[(1 + \delta_{ij}) I_{4,ij}^{[d+]} \right]^2 + g^{\mu\nu} \left[-\frac{1}{2} I_4^{[d+]} \right] \quad (38)$$

Further, at this point, we have to reduce the scalar integrals $I_{4,ij}^{[d+]}$ etc. to generic dimension d with Tarasov's recurrence relations, see next slide.

The $I_4^{\mu\nu}$ is naturally free of $1/(\epsilon)_5$.

Reduction of tensor integrals \Rightarrow express them by a (very) small set of scalar integrals

Presently needed for massive processes:

$$n \leq 6 \text{ and rank } R \leq n$$

For box diagrams and simpler ones:

Use of the 'conventional' Passarino-Veltman reduction

[Passarino:1978jh [1]]

Examples:

- LO (Lowest order) of e.g. $Z \rightarrow e + \mu$ is one-loop
[Riemann:1981 [17], Mann:1983 [18]]
- NLO: one-loop corrections to e.g. $H \rightarrow \tau^+ \tau^-$, WW , ZZ
[Fleischer:1980 [19]]
- NNLO: e.g. radiative loop corrections $e^+ e^- \rightarrow e^+ e^- \gamma$
(here with 5-point functions)

Some opensource packages

- package **FF** [vanOldenborgh:1990 [4]]
- package **LoopTools/FF v.2**
[Hahn:1998,2006 [3]] – covers also 5-point functions, rank $R \leq 4$
 $1/\epsilon^2$ not covered, and we observed sometimes problems in
certain configurations with light-like external particles
- package **Golem95** [Binoth:2008 [16]] for $n \leq 6$, but only massless
propagators
- Mathematica package **hexagon.m** [Diakonidis:2008 [20, 8]] for $n \leq 6$,
rank $R \leq 4$
- package for all $n \leq 4$ scalar integrals: **QCDloop** [Ellis:2007 [21]]
- see also: review **A.Denner**, DESY TH workshop 2009
- **Our approach:**
Package **hexagon.m** by Kajda et al.
Package **olotic.F** by Diakonidis et al.
In preparation: C++ package **fry** by V. Yundin et al.

Crucial contributions [of course, list is incomplete ...] \Rightarrow

- [Campbell:1996 [22]]
- [Denner:2002,2005 [23, 14]]
- [Binoth:1999,2005 [24, 13]]
- [Bern:1993 [25]]
- [Ossola:2006 [26]]

In the following, I will describe recent developments in the Fleischer-Davydychev-Tarasov approach.

- [Davydychev:1991, Tarasov:1996, Fleischer:1999, Diakonidis:2008,2009 [5, 6, 7, 8, 9]]

- get tensor reduction
- kill pentagon-Gram det's
- treat sub-Gram det's

Algebraic simplifications, 2nd step

Work out the red part in

$$\binom{0}{0}_5 I_5^{\mu\nu\lambda} = \left[\binom{0}{0}_5 I_5^{\mu\nu} - \sum_{s=1}^5 \binom{s}{0}_5 I_4^{\mu\nu,s} \right] Q_0^\lambda - \sum_{s=1}^5 I_4^{\mu\nu,s} \overline{Q}_s^{0,\lambda}$$

\Rightarrow Use of identities for the determinants
work!!!

$$\binom{0}{0}_5 \binom{s}{i}_5 = \binom{0s}{0i}_5 \binom{0}{0}_5 + \binom{0}{i}_5 \binom{s}{0}_5 \quad (39)$$

$$\binom{s}{i}_5 \frac{\binom{0}{j}_5}{\binom{0}{0}_5} = -\binom{0i}{sj}_5 + \binom{s}{0}_5 \frac{\binom{i}{j}_5}{\binom{0}{0}_5}, \quad g^{\mu\nu} = 2 \sum_{i,j=1}^4 \frac{\binom{i}{j}_5}{\binom{0}{0}_5} q_i^\mu q_j^\nu \quad (40)$$

$$\binom{s}{0}_5 \binom{0s}{is}_5 = \binom{s}{i}_5 \binom{0s}{0s}_5 - \binom{s}{s}_5 \binom{0s}{0i}_5 \quad (41)$$

$$\binom{s}{0}_5 \binom{ts}{js}_5 = \binom{s}{j}_5 \binom{ts}{0s}_5 - \binom{s}{s}_5 \binom{ts}{0j}_5 \quad (42)$$

Algebraic simplifications, 2nd step

⇒
work!!!

Use of identities for the determinants

$$\binom{s}{0}_5 \binom{is}{js}_5 = \binom{s}{i}_5 \binom{0s}{js}_5 + \binom{s}{s}_5 \binom{0i}{sj}_5 \quad (43)$$

$$\binom{s}{s}_5 \binom{0st}{0st}_5 = \binom{0s}{0s}_5 \binom{st}{st}_5 - \binom{ts}{0s}_5^2 \quad (44)$$

$$\left[\binom{ts}{0s}_5 \binom{ust}{jst}_5 - \binom{ts}{js}_5 \binom{ust}{0st}_5 \right] \binom{s}{s}_5 = \left[\binom{ts}{0s}_5 \binom{us}{js}_5 - \binom{ts}{js}_5 \binom{us}{0s}_5 \right] \binom{st}{st}_5 \quad (45)$$

$$\sum_{t=1}^5 \binom{ts}{is}_5 = 0 \quad (46)$$

Express pentagons $I_5^\mu, I_5^{\mu\nu}, I_5^{\mu\nu\lambda}$ etc. by d -shifted scalar boxes I

Intermediate result with $I_4^{[d+],s}, I_{4,ij}^{[d+]^2,s}$ etc.

$$I_5^\mu = - \sum_{i=1}^4 \left[\frac{1}{\binom{0}{0}_5} \sum_{s=1}^5 \binom{0i}{0s}_5 I_4^s \right] q_i^\mu \quad (47)$$

$$I_5^{\mu\nu} = \sum_{i,j=1}^4 q_i^\mu q_j^\nu E_{ij} + g^{\mu\nu} E_{00} \quad (48)$$

$$E_{ij} = \frac{1}{\binom{0}{0}_5} \sum_{s=1}^5 \left[\binom{0i}{sj}_5 I_4^{[d+],s} + \binom{0s}{0j}_5 I_{4,i}^{[d+],s} \right] \quad (49)$$

$$E_{00} = -\frac{1}{2} \frac{1}{\binom{0}{0}_5} \sum_{s=1}^5 \binom{s}{0}_5 I_4^{[d+],s} \quad (50)$$

Express pentagons $I_5^\mu, I_5^{\mu\nu}, I_5^{\mu\nu\lambda}$ etc. by d -shifted scalar boxes II

$$I_5^{\mu\nu\lambda} = \sum_{i,j,k=1}^4 q_i^\mu q_j^\nu q_k^\lambda E_{ijk} + \sum_{k=1}^4 g^{[\mu\nu} q_k^{\lambda]} E_{00k} \quad (51)$$

$$E_{ijk} = -\frac{1}{\binom{0}{0}_5} \sum_{s=1}^5 \left\{ \left[\binom{0j}{sk}_5 I_{4,i}^{[d+]^2,s} + (i \leftrightarrow j) \right] + \binom{0s}{0k}_5 \nu_{ij} I_{4,jj}^{[d+]^2,s} \right\} \quad (52)$$

$$E_{00j} = \frac{1}{\binom{0}{0}_5} \sum_{s=1}^5 \left[\frac{1}{2} \binom{0s}{0j}_5 I_4^{[d+],s} - \frac{d-1}{3} \binom{s}{j}_5 I_4^{[d+]^2,s} \right] \quad (53)$$

These presentations are evidently free of inverse Gram determinants.

OLD Numerics, 2010-01-29 : LoopTools versus our approach

Using LoopTools call and our math numerics (preliminary):
